General

Is there an easy way to output the email addresses of data from our pool?

There's a few different ways, but the easiest is:

1. Select the "Manager" toolbar button
2. Select all the rows in the list on the left (underneath "Display" label)
3. Select the "Selected >>" button
4. Select all the emails from the "To..." field, Copy and Paste.

You can also Choose File -> Export File, save it as "Excel" and open this file from within Excel. This file includes everything about each entry so you will then simply remove any columns as necessary.
